

Cut your fire risk in half with Farm Defender from Co-operators.

What is Farm Defender?

It's our commitment to farm fire safety.

This program offers insurance discounts when you install approved monitoring devices to prevent electrical fires.

How does electrical monitoring work?

Monitors are placed in your barns and other susceptible structures.

They check for faults in your electrical system, around the clock.

You get instant alerts when faults are detected, so you can fix them before fires start or spread.

Electrical monitoring is cyber safe.

Your information won't be shared with third parties, including Co-operators, unless you consent.

Why is electrical monitoring essential?

Fire is all too common on farms, where hazards like corrosive gases, humidity and rodents wear down electrical components.

It doesn't take long for minor faults to become major mishaps.

In fact, roughly 50% of all barn fires are caused by faulty electrical systems.

Early detection can prevent those fires – effectively cutting your fire risk in half.

What are the benefits?

With electrical monitoring, your livestock, equipment and structures are safer.

Your business is less likely to lose income from unexpected downtime.

And you save on insurance with our Farm Defender discount.

Get up to 10%* off your premium for any structure with an approved monitoring device.
